1.1.2. Conditional Calculation Based on the Number of Digits1432

Write a Python program that accepts an integer n as input. Depending on the number of digits in n .

Constraints:
 $1 \leq n \leq 999$

Input Format:
• The input consists of a single integer n .

Output Format:
• If n is a single-digit number, print its square.
• If n is a two-digit number, print its square root (rounded to two decimal places).
• If n is a three-digit number, print its cube root (rounded to two decimal places).
• Else print "Invalid".

Sample Test Cases

condition...

```
1 import math
2 number=int(input())
3 if 1 <= number <= 9:
4     print(number**2)
5 elif 10 <= number <= 99:
6     print(f"{math.sqrt(number):.2f}")
7 elif 100 <= number <= 999:
8     print(f"{math.cbrt(number):.2f}")
9 else:
10    print("Invalid")
11

1.1.3. Days between Two Dates

Write a Python program to calculate number of days between two dates.

Input Format:

- The first line contains the first date in the format `YYYY - MM - DD`.
- The second line contains the second date in the format `YYYY - MM - DD`.

Output Format:

- An integer representing the number of days between the given dates.

Note:

- The first date should always be considered earlier than the second date.

Sample Test Cases

The screenshot displays the CodeTantra web application interface. On the left, the challenge '1.1.4. Reverse a Number' is described, asking for a Python program to reverse a number's digits. The input and output formats are specified. The main area shows the user's submitted Python code in the 'reverseN...' editor. Below the code, the execution results are displayed, indicating that all test cases passed. The first test case details show an expected output of 5507 and an actual output of 5507. The bottom of the screen shows the Windows taskbar with various application icons and the system clock.

1.1.4. Reverse a Number

Write a Python program to reverse the digits of the number and print the reversed number.

Input Format:

- The input is a single integer.

Output Format:

- The output prints a single integer, which is the reversed number.

Sample Test Cases

reverseN...

```
1 num=int(input())
2 reversed_num=int(str(num)[::-1])
3 print(reversed_num)
```

1.1.5. Multiplication Table

04/23

Write a Python program that takes an Integer as input and prints the multiplication table for that Integer from 1 to 10.

Input Format:

- The first line of input contains an Integer that represents the number for which the multiplication table is to be printed.

Output Format:

- Print the multiplication table for the given number in the format:

<number> x <multiplier> = <result>

Note:

- The character "x" is used in the output to represent multiplication.
- Refer to the visible test-cases for more clarity.

1.2.1. Pass or Fail

0.009 s

Write a Python program that accepts the number of courses and the marks of a student in those courses. The grade is determined based on the aggregate percentage:

- If the aggregate percentage is greater than 75, the grade is Distinction.
- If the aggregate percentage is greater than or equal to 60 but less than 75, the grade is First Division.
- If the aggregate percentage is greater than or equal to 50 but less than 60, the grade is Second Division.
- If the aggregate percentage is greater than or equal to 40 but less than 50, the grade is Third Division.

Input Format:

- The first input will be an integer n , the number of courses.
- The second input will be n integers representing the marks of the student in each of the n courses, separated by a space.

Output Format:

If the student passes all courses:

- Print the aggregate percentage (formatted to two decimal places).
- Print the grade based on the aggregate percentage.

If the student fails any course (marks < 40 in any course), print:

- "Fail".

Note:

- Aggregate Percentage: Average performance across all courses, calculated by summing all marks and dividing by the number of courses.

1.2.3. Pattern - 1

01:11

Write a Python program to print a pattern of asterisks in the form of a right-angled triangle.

Input Format:

The input is an integer, representing the number of rows in the pattern.

Output Format

The output should display the pattern of asterisks (*), with each row containing an increasing number of asterisks.

Note: Refer to the displayed test cases for the sample pattern.
